

They are going to destroy you with the climate

We are standing at the precipice of a very deep ravine Things are moving really fast now and all the things we have warned about for the past ten years now seem to be coming together.

The climate becomes the hammer with which they will completely destroy your personal life.

We are now truly in the critical phase of the Endgame, the battle of light against dark. The dark represented here on Earth by a satanic cult, the Illuminati mafia.

This mafia is in a hurry and now wants to act quickly on all fronts, before the sleeping part of the population has time to wake up.

With the fake corona pandemic, the first step has been given and with the climate they will destroy what is left of your personal life.

For example, there was an article in the printed Telegraaf this morning about the new plans of Frans Timmermans with his sidekick Diederik Samson. This Batman and Robin have decided that it is time for European citizens to pay for the climate, because after all, Europe has to repay the loans they have taken out.

So, in the context of the climate, they will impose stricter CO2 standards on (energy) companies, so that they have fewer CO2 rights or have to buy them more, which will have consequences for the electricity, gas and petrol prices of the consumer.

So preparing your food, heating and moving around is going to be considerably more expensive than it already is.

But, even more disturbing is that plans are now emerging for a consumer's personal CO2 budget. Every household would then receive a personal annual budget of an x amount of CO2 emissions and within that you have "the freedom" to do what you want. If you want to shower longer than prescribed, you can, but it will be at the expense of something else that you can no longer do.

It's an insane system, where the knife cuts multiple ways for the mafia. They are not concrete proposals at the moment, but the fact that entire pages are being devoted to it in the mainstream media means that it is coming.

Research agency TNO presented the idea for such a personal CO2 budget to a representative group of Dutch people. And guess what? They often don't want it. Only 36 percent see something in a CO2 budget. If large companies have to pay more for their emissions, that picture suddenly changes. Then 67 percent agree. Household income must also be taken into account.

So there is support, subject to conditions. But how much could you still emit? In the TNO proposal, each household has 5.5 tons of CO2 emissions to spend in 2030; flying, driving, energy and eating meat. That number is based on the Climate Agreement and the expected CO2 emissions per household in 2030, which are lower than now.

It's the same game as always. The citizen doesn't want it, but change a small thing and suddenly they want it. If you think it's an insane system to start with and don't want to participate in it, but a little later you do because the big companies also have to pay more, then you really have something loose,

or they are manipulated research results (the chance with the latter is not inconsiderable). So what they're basically saying is that this system can be sold to the general public. As long as attention is focused on large companies, citizens will also be happy to do their part.

So, once that bump has been taken, it's a matter of some extra propaganda for a while and then a proposal from Brussels from the aforementioned Batman and Robin to do it that way. For each citizen it's exactly kept up what they do. How many burgers he buys and how many car rides he makes and what time he lowers the thermostat in the evening.

They have also thought about how this should be registered. Researcher Joost Gerdes admits that it would be a major operation to set up such a CO2 system. Just think, just for the meat: every restaurant, every butcher and every supermarket should add for each meat product how much CO2 emissions it causes and convert that into CO2 points. Gerdes suggests that how many points you (still) have can be recorded in your bank app. There would therefore be no need for a megalomaniac monitoring system from the government. "We also saw that fear in the answers from respondents." In the bank app you could see how many CO2 points you still have. "In addition to euros, you also have to pay CO2 points."

"There would be no megalomaniac monitoring system needed from the government," the man claims. The system itself is a megalomaniac monitoring system, but that is something that is unlikely to register with the average citizen.

What of course this also automatically would mean is the end of cash. If you pin 50 euros and spend this here and there on hamburgers or other CO2 emitting products, this cannot be traced. How should the seller register the CO2 points associated with the hamburger with the buyer who pays with a 20 euro note and does not have a smartphone?

What it will be and where we are going can be seen in Gerdes' final conclusion: In any case, it is worth looking at measures, such as a CO2 budget, that tries to change people's behaviour, Gerdes believes. "We do not say: you should introduce such a CO2 budget. But until now we have tried to reduce CO2 emissions by using more sustainable energy, CO2 storage or saving energy. You can see that that does not yield enough."

According to the Dutch Environmental Assessment Agency, the rate at which the Netherlands is currently reducing CO2 emissions is indeed still too low. So there might be a gear up. But encouraging behavioral change is something most politicians do not dare to do. "But now it appears that there is more support for this than you would expect. I hope that this will be looked at", Gerdes concludes.

Despite all the measures that have already been taken, it does not yield enough and therefore there is no escaping a personal CO2 budget for every household. There will be a lot of sputtering, but in the end the flap (pr clap) cattle in parliament always agrees and that will be no different this time.
